

GB Market Summary September 2024

Published October 2024

Aurora provides market leading forecasts & data-driven intelligence for the global energy transition

A U R  R A

Executive Summary

- The average power price in September was £77.2/MWh, a 34% increase since the average of £57.6/MWh in August.
- The increase in power price was driven by increasing gas and carbon prices, higher demand, and less low carbon generation, which fell 19.4% month-on-month. This was due to lower wind speeds. An unplanned outage in the ElecLink interconnector also put upward pressure on power prices.
- Consequently, domestic power sector emissions totalled 2.3MtCO₂e, an 85% increase relative to the month prior.
- The UK-ETS traded at an average of £40.0/tCO₂ in September, a £0.8/tCO₂ increase relative to August.

		Monthly value ¹	Month-on-month change	Year-on-year change
System Performance	Power prices, £/MWh	77.2	+19.6 (34.0%)	-5.2 (6.3%)
	Gas prices, £/MWh	29.7	+1.1 (4.0%)	-1.7 (5.4%)
	Carbon ² prices, £/tCO ₂	57.9	+0.7 (1.3%)	+1.0 (1.8%)
	Transmission demand, TWh	18.9	+0.9 (5.1%)	+0.1 (0.5%)
	Low carbon ³ generation, TWh	12.2	-2.9 (19.4%)	+0.2 (2.1%)
	Thermal ⁴ generation, TWh	4.9	+2.5 (105.0%)	-1.9 (28.4%)
	Grid carbon intensity, gCO ₂ e/kWh	131.4	+62.2 (89.7%)	-30.5 (18.8%)
Capture Prices	Offshore wind, £/MWh	70.6	+23.3 (49.4%)	-0.9 (1.2%)
	Onshore wind, £/MWh	69.0	+22.2 (47.5%)	-3.8 (5.2%)
	Solar PV, £/MWh	71.7	+22.0 (44.2%)	-7.0 (8.9%)

		Monthly value ¹	Variance to historical monthly average ⁵
Load Factors	Offshore wind, %	32.3	-2.2 p.p.
	Onshore wind, %	22.0	-2.6 p.p.
	Solar PV, %	9.1	-2.1 p.p.

1) Values averaged over the calendar month. 2) Includes CPS and EU ETS until 18th May 2021 and UK ETS from 19th May 2021 onwards; 3) Includes renewables and nuclear generation 4) Includes CCGTs, coal and other fossil plants; 5) Comparing to the average of same month in the previous 5 years.

Data used

- Output values used in this summary reflect the sum of Final Physical Notifications (FPN) submitted by all BM Units of a given plant that have been active over the last three months.
- Capacity values used in this summary reflect the sum of capacities of individual BM Units, as reported to the Balancing Mechanism, that have been active over the last three months. They reflect long-term capacities and exclude temporary fluctuations due e.g. to plant failures or scheduled maintenance.
- Prices used in this summary are the EPEX half-hourly Reference Prices for half-hourly, two-hourly and four-hourly spot products.

Categories presented

- Full-load hours represent the plants' load factors, calculated as the ratio of the output produced in a given month to the maximum possible output given the plants' capacity.
- Running hours represent the proportion of time in a given month when a plant has been active, i.e. when at least one of its BM Units produced output greater than zero.
- Capture prices (or average output-weighted prices) are calculated as an average of EPEX half-hourly prices per MWh weighted by the plants' corresponding half-hourly outputs for all periods.
- Average gross margins are calculated as a sum of the uplift and inframarginal rent. Uplift is calculated as the difference between the EPEX price and the system marginal cost (SMC). SMC is the maximum marginal cost of all the plants with at least one generator producing above 80% of its installed capacity in a given half-hour.
- Emissions are calculated as plant output divided by electrical efficiency, multiplied by theoretical carbon content of the fuel input. The carbon content of fuel inputs is sourced from BEIS's Greenhouse gas reporting – Conversion factors 2016. System carbon intensity is calculated as the total emission divided by total electricity generated.
