Executive Summary

- The average power price in February was £135.9 /MWh, a 4.3% increase since the average of £130.3/MWh in January.
- The UK-ETS traded at an average of £79.3/tCO₂ in February, a £13.8/tCO₂ increase relative to January
- Generation from renewable technologies, i.e., onshore wind, offshore wind and solar PV was 7.2 TWh, 24% lower relative to January
- The total demand in February was 20.96 TWh, 14% lower relative to January and 18% lower relative to February 2022.
- Due to the lower renewable generation, domestic power sector emissions totalled 3.4 MtCO₂e, the same as January, despite lower demand – a 17% increase in emissions intensity.

		Monthly value ¹	Month-on-month change	Year-on-year change	Slide reference(s)
System Performance	Power prices, £/MWh	135.9	+5.6 (4.3%)	-21.3 (13.6%)	<u>5, 6</u>
	Gas prices, £/MWh	45.8	-7.5 (14.1%)	-18.7 (29.0%)	<u>8</u>
	Carbon ² prices, £/tCO ₂	101.0	+13.8 (15.8%)	-2.1 (2.0%)	<u>8</u>
	Transmission demand, TWh	21.0	-3.5 (14.2%)	-0.4 (2.1%)	<u>12</u>
	Low carbon ³ generation, TWh	11.2	-3.5 (23.9%)	-4.9 (30.5%)	<u>13, 14</u>
	Thermal ⁴ generation, TWh	7.6	+0.2 (2.1%)	+2.4 (46.9%)	<u>13, 14</u>
Capture Prices	Grid carbon intensity, gCO ₂ e/kWh	179.9	+26.4 (17.2%)	+60.0 (50.0%)	<u>16</u>
	Offshore wind, £/MWh	126.1	+6.2 (5.2%)	-28.4 (18.4%)	<u>20</u>
	Onshore wind, £/MWh	130.7	+13.1 (11.2%)	-23.9 (15.4%)	<u>20</u>
	Solar PV, £/MWh	130.5	-11.5 (8.1%)	-25.5 (16.4%)	<u>20</u>

		Monthly value ¹	Variance to historical monthly average ³	Slide reference(s)
Load Factors	Offshore wind, %	45.9	-12.1 p.p.	<u>19</u>
	Onshore wind, %	35.1	-7.8 p.p.	<u>19</u>
	Solar PV, %	6.0	-0.6 p.p.	<u>19</u>

1) Values averaged over the calendar month. 2) Includes CPS and EU ETS until 18th May 2021 and UK ETS from 19th May 2021 onwards; 3) Includes renewables and nuclear generation 4) Includes CCGTs, coal and other fossil plants; 5) Comparing to the average of same month in the previous 5 years.

EPEX spot price¹
£/MWh

1) Half-hourly EPEX is the volume-weighted reference price over that half-hour interval, as provided by EPEX Spot. 2) De-Rated Margin Forecast calculated in accordance with the Loss of Load Probability Calculation Statement from Elexon.

Daily February max and min demand

Relative to historic February max and min demand since 2010¹

Demand²
GW

I Daily range ■ Historic maximum/minimum

1) Data from previous years is matched to the nearest weekday within the current month, to maintain the weekly demand pattern. 2) Demand data presented here is Initial Transmission System Demand Out-Turn, and does not include embedded demand.

Monthly historical demand on the transmission system

Total demand¹
TWh

— Total monthly demand — Annual average demand (x) Month-on-month difference (x) Year-on-year difference

1) Demand data presented here is Initial Transmission System Demand Out-Turn, and includes station transformer load, pumped storage demand and interconnector demand, but does not include embedded demand.

Monthly fuel mix breakdown

Output¹
TWh

Load factor
%

1) Includes outputs from generators registered as BM Units as well as embedded wind and solar PV assets. All numbers are rounded to 0.1 TWh which means that subtotals may not sum to total value. 2) Other fossil includes oil, CHP-CCGT and OCGT. 3) Other renewables includes biomass and hydro.

Historical fuel mix breakdown

Output¹
% of total

■ Nuclear ■ Coal ■ CCGT ■ Other fossil² ■ Other renewables³ ■ Onshore Wind ■ Offshore Wind ■ Solar ■ Imports

1) Includes outputs from generators registered as BM Units as well as embedded wind and solar PV. 2) Other fossil includes oil, CHP-CCGT and OCGT. 3) Other renewables includes biomass and hydro.

Monthly interconnector flow duration curve

Flow in each half-hour for GB interconnectors

1) Positive flow is imports into GB, negative flow is exports.

Monthly emissions by technology

1) Please refer to Appendix for details of methodology employed to calculate emission amounts. Includes all Balancing Mechanism plants. 2) Other fossil includes oil, OCGT and gas CHP-CCGT.

Plant utilisation – load factors by plant for February

Load factor¹
%

Column width
reflects capacity

1) Represents 60 plants with highest capacity according to the Balancing Mechanism (BM) database, as well as aggregated data for wind and solar. Capacity of each plant represents the sum of capacities of all its generators that have been active at least once in the last three months. Please refer to Appendix for a detailed description of the data used and categories presented

Data used

- Output values used in this summary reflect the sum of Final Physical Notifications (FPN) submitted by all BM Units of a given plant that have been active over the last three months.
- Capacity values used in this summary reflect the sum of capacities of individual BM Units, as reported to the Balancing Mechanism, that have been active over the last three months. They reflect long-term capacities and exclude temporary fluctuations due e.g. to plant failures or scheduled maintenance.
- Prices used in this summary are the EPEX half-hourly Reference Prices for half-hourly, two-hourly and four-hourly spot products.

Categories presented

- Full-load hours represent the plants' load factors, calculated as the ratio of the output produced in a given month to the maximum possible output given the plants' capacity.
- Running hours represent the proportion of time in a given month when a plant has been active, i.e. when at least one of its BM Units produced output greater than zero.
- Capture prices (or average output-weighted prices) are calculated as an average of EPEX half-hourly prices per MWh weighted by the plants' corresponding half-hourly outputs for all periods.
- Average gross margins are calculated as a sum of the uplift and inframarginal rent. Uplift is calculated as the difference between the EPEX price and the system marginal cost (SMC). SMC is the maximum marginal cost of all the plants with at least one generator producing above 80% of its installed capacity in a given half-hour.
- Emissions are calculated as plant output divided by electrical efficiency, multiplied by theoretical carbon content of the fuel input. The carbon content of fuel inputs is sourced from BEIS's Greenhouse gas reporting – Conversion factors 2016. System carbon intensity is calculated as the total emission divided by total electricity generated.
