

GB Market Summary April 2022

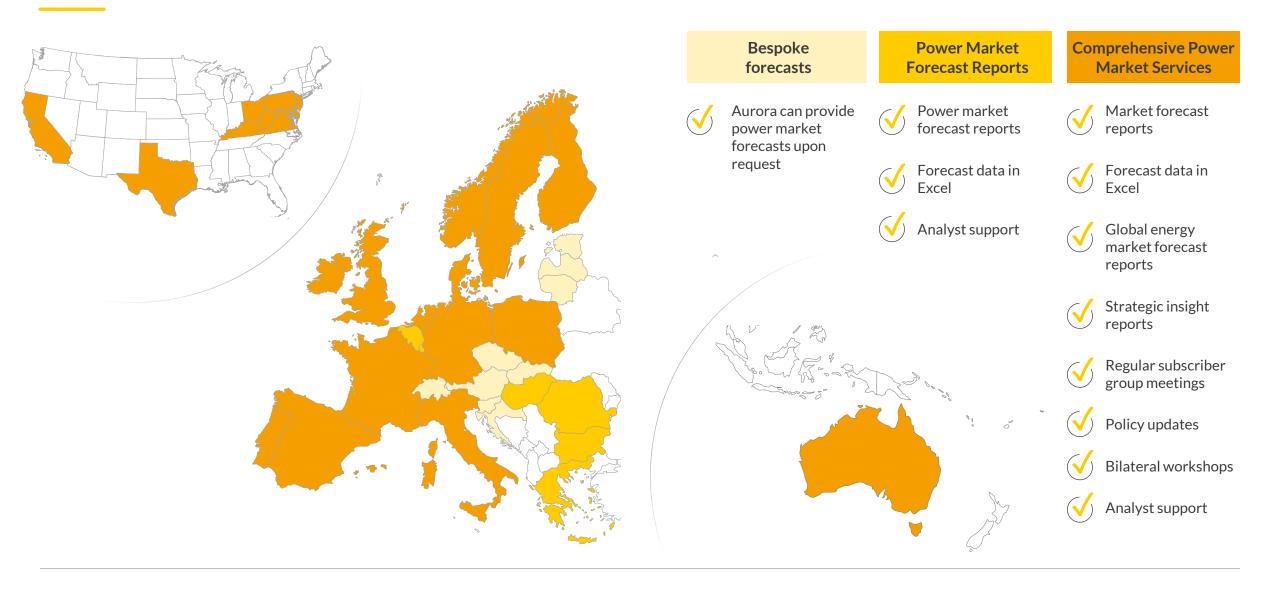

Published May 2022

Public Version

Aurora offers power market forecasts and market intelligence spanning Europe's key markets, Australia and the US

Executive Summary

- The average power price in April was £171.1 /MWh, a 28% decrease from March. This was driven by a 44% fall in gas prices coupled with a 13% fall in demand.
- Average capture prices for offshore wind and onshore wind decreased by 28% and 30% from March to £170.1/MWh and £166.4/MWh respectively, while solar capture prices decreased by 25% to £160.5/MWh.
- Average solar load factors increased 30% (reflecting the season change) while onshore wind load factors decreased 11% and offshore wind load factors remained similar to March (1% increase).
- The UK-ETS traded at an average of £78/tCO2 in April, a £2/tCO2 increase relative to March.

This is a slimmed down version of our subscriber monthly note. For more information on Aurora's $AUR \otimes RA$ monthly notes and forecasting services please contact cara.valentine@auroraer.com

		Monthly value ¹	Month-on-month change	Year-on-year change	Slide reference(s)
System Performance	Power prices, £/MWh	171.1	-65.7 (27.7%)	+104.6 (157.1%)	<u>5, 6</u>
	Gas prices, £/MWh	57.2	-45.7 (44.4%)	+38.5 (206.3%)	<u>8</u>
	Carbon ² prices, £/tCO ₂	96.1	+2.1 (2.2%)	+39.4 (69.5%)	<u>8</u>
	Transmission demand, TWh	20.5	-2.4 (10.5%)	-0.3 (1.5%)	<u>12</u>
	Low carbon ³ generation, <i>TWh</i>	12.3	-0.9 (6.7%)	+1.6 (14.9%)	<u>13, 14</u>
	Thermal ⁴ generation, TWh	9.4	-0.3 (3.3%)	-1.1 (10.3%)	<u>13, 14</u>
	Grid carbon intensity , gCO ₂ e/kWh	187.5	-3.9 (2.0%)	-26.9 (12.5%)	<u>16</u>
Capture Prices	Offshore wind, £/MWh	170.1	-64.9 (27.6%)	+109.9 (182.6%)	<u>20</u>
	Onshore wind, £/MWh	166.4	-69.6 (29.5%)	+106.9 (179.6%)	<u>20</u>
	Solar PV, £/MWh	160.5	-54.0 (25.2%)	+97.4 (154.3%)	<u>20</u>

		Monthly value ¹	Variance to historical monthly average ⁵	Slide reference(s)
Load Factors	Offshore wind, %	39.3	+4.9 p.p.	<u>19</u>
	Onshore wind, %	23.9	-1.5 p.p.	<u>19</u>
	Solar PV, %	14.8	-0.1 p.p.	<u>19</u>

¹⁾ Values averaged over the calendar month. 2) Includes CPS and EU ETS until 18th May 2021 and UK ETS from 19th May 2021 onwards; 3) Includes renewables and nuclear generation 4) Includes CCGTs, coal and other fossil plants; 5) Comparing to the average of same month in the previous 5 years.

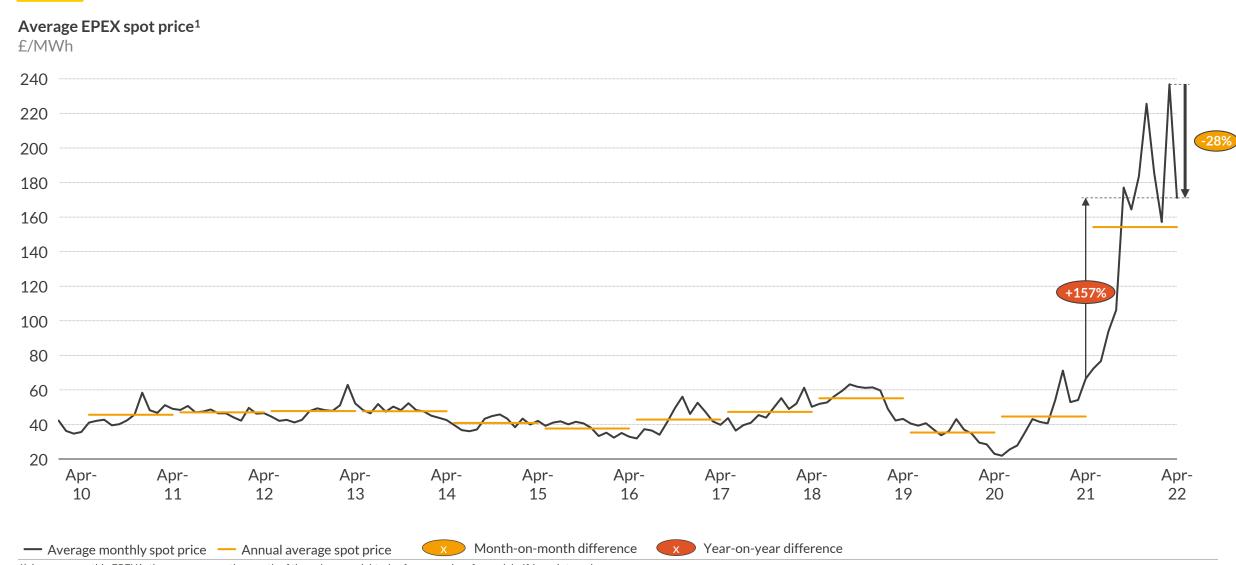

Agenda

- I. Wholesale market summary
- II. Renewable performance (redacted)
- III. Company performance (subscriber only)
- IV. Plant performance (redacted)
- V. Balancing mechanism summary

Historic monthly average EPEX spot price

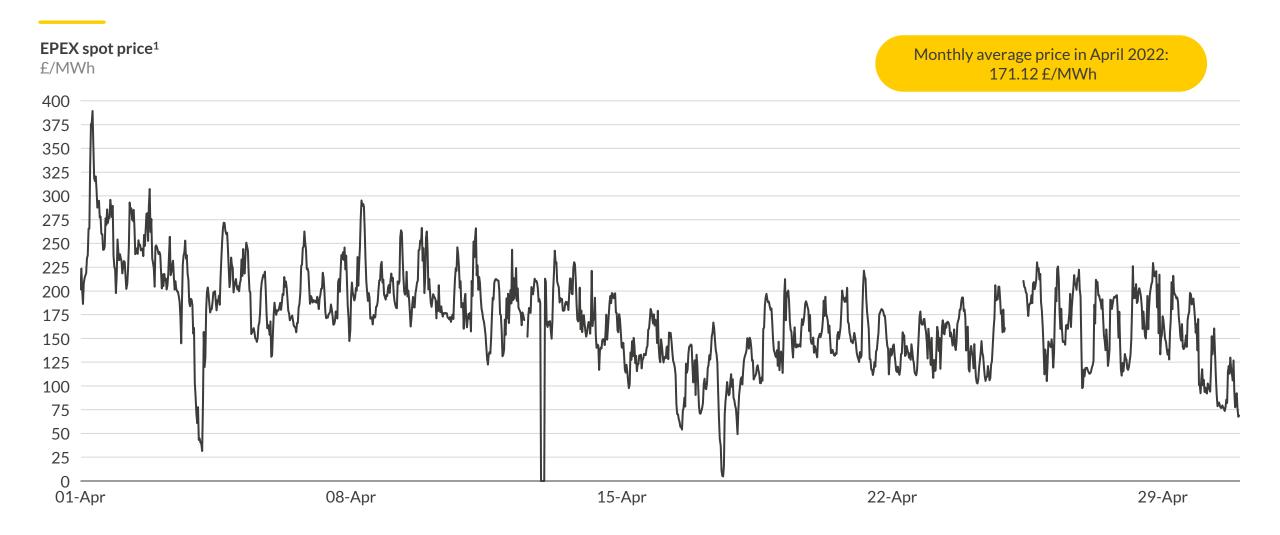

¹⁾ Average monthly EPEX is the average over the month of the volume-weighted reference prices for each half-hour interval.

Half-hourly EPEX spot price for April

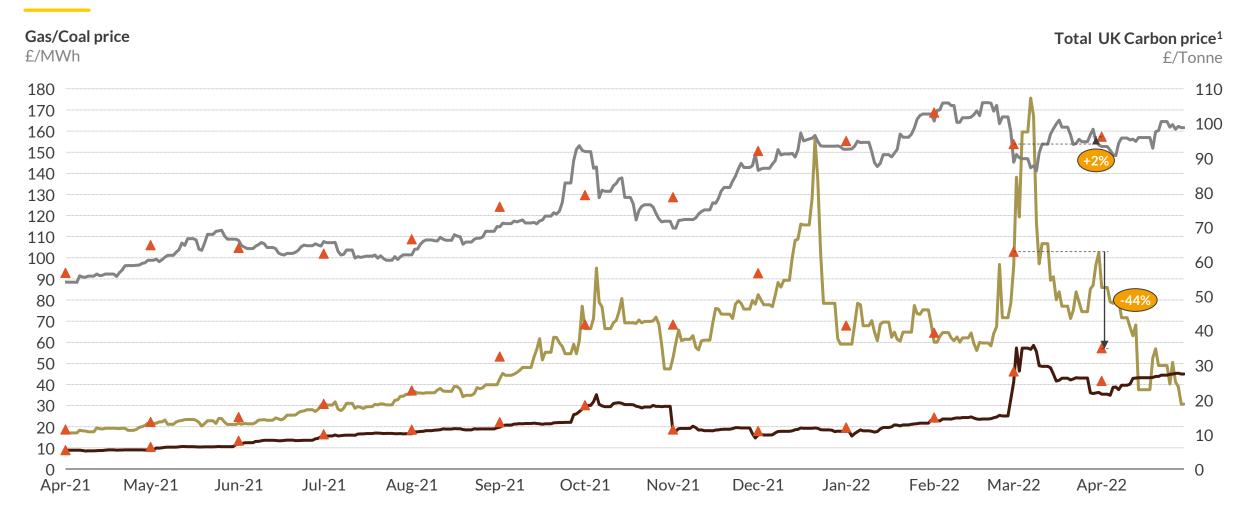

¹⁾ Half-hourly EPEX is the volume-weighted reference price over that half-hour interval, as provided by EPEX Spot

Historic fuel prices Gas, Coal and Carbon daily prices

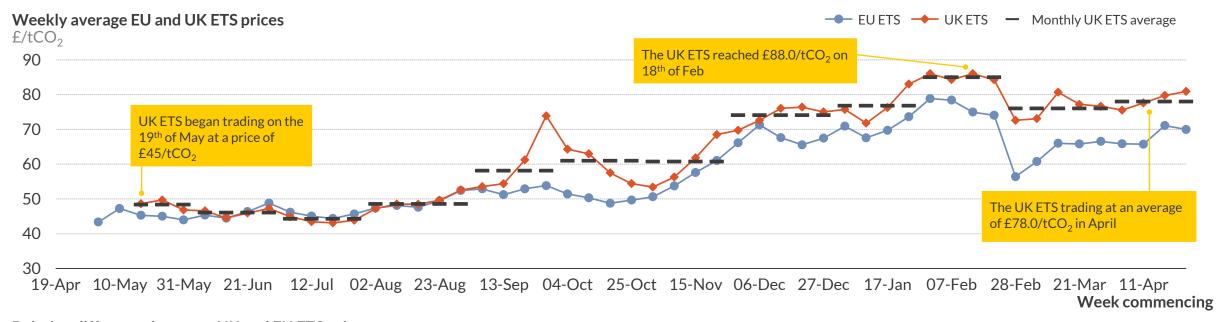

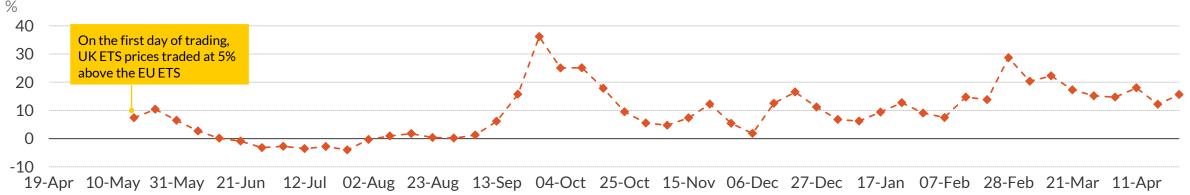

^{1) 1)} Includes CPS and EU ETS until 18th May 2021 and UK ETS from 19th May 2021 onwards.

Historic weekly UK ETS and EU ETS Prices

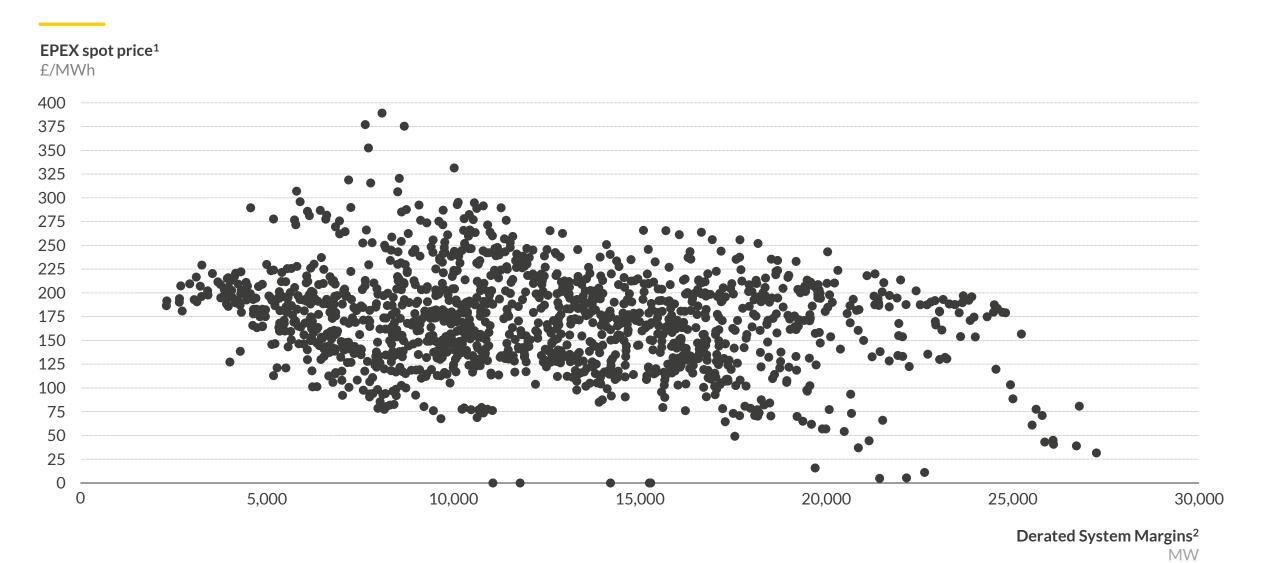

Week commencing

Half-hourly spot prices against half-hourly system margins for April

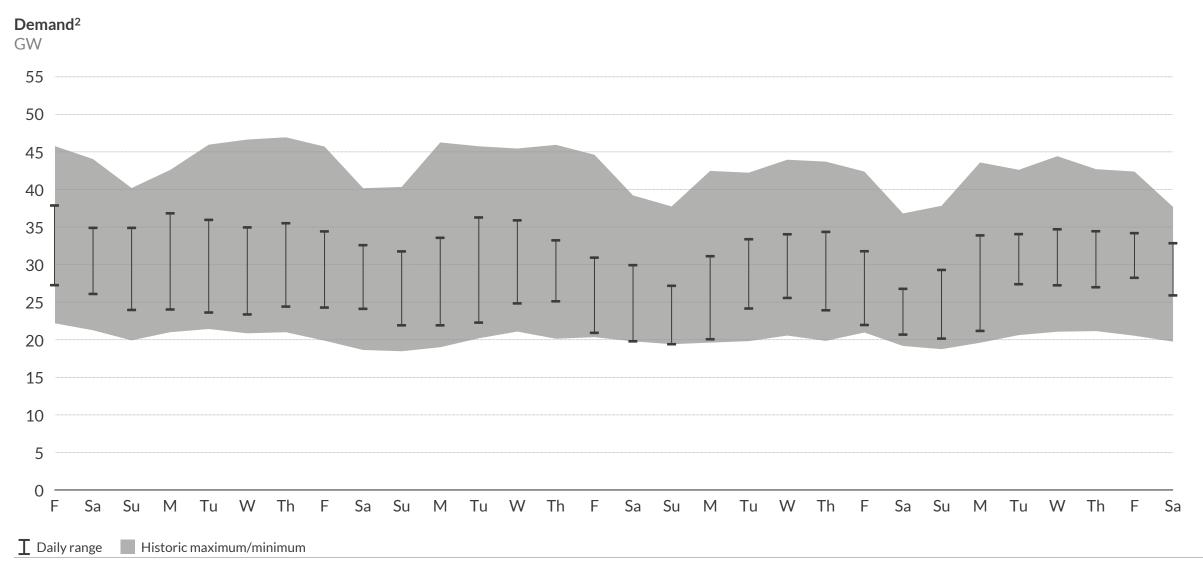

¹⁾ Half-hourly EPEX is the volume-weighted reference price over that half-hour interval, as provided by EPEX Spot. 2) De-Rated Margin Forecast calculated in accordance with the Loss of Load Probability Calculation Statement from Elexon.

Daily April max and min demand Relative to historic April max and min demand since 2010¹

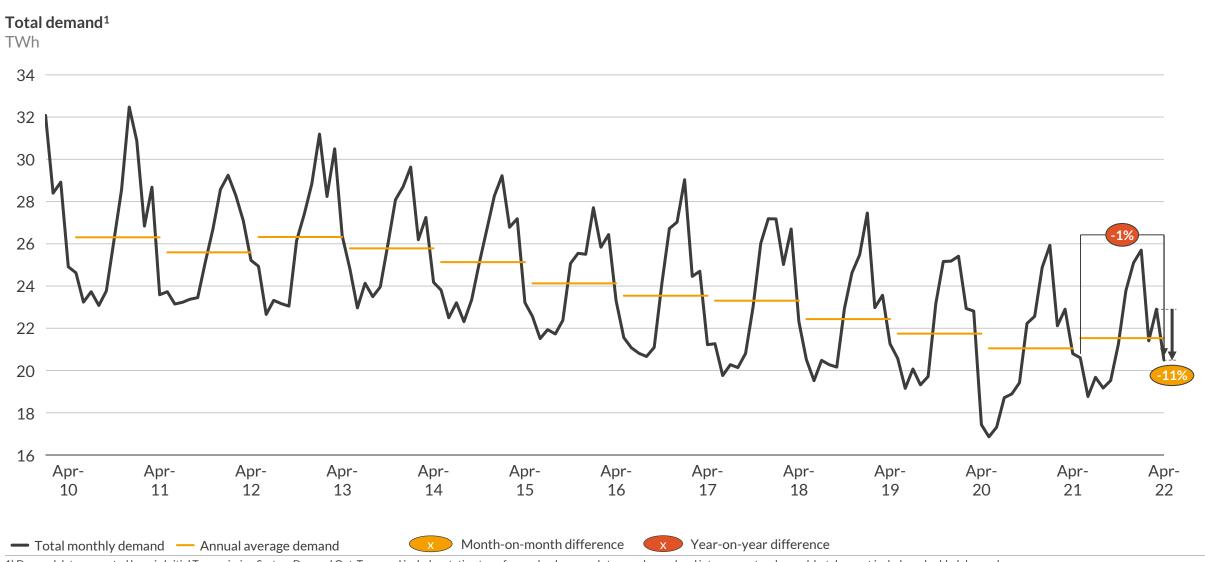

¹⁾ Data from previous years is matched to the nearest weekday within the current month, to maintain the weekly demand pattern. 2) Demand data presented here is Initial Transmission System Demand Out-Turn, and does not include embedded demand.

Sources: National Grid, Aurora Energy Research CONFIDENTIAL 10

Monthly historical demand on the transmission system

¹⁾ Demand data presented here is Initial Transmission System Demand Out-Turn, and includes station transformer load, pumped storage demand and interconnector demand, but does not include embedded demand.

Sources: National Grid, Aurora Energy Research CONFIDENTIAL 11

Monthly fuel mix breakdown

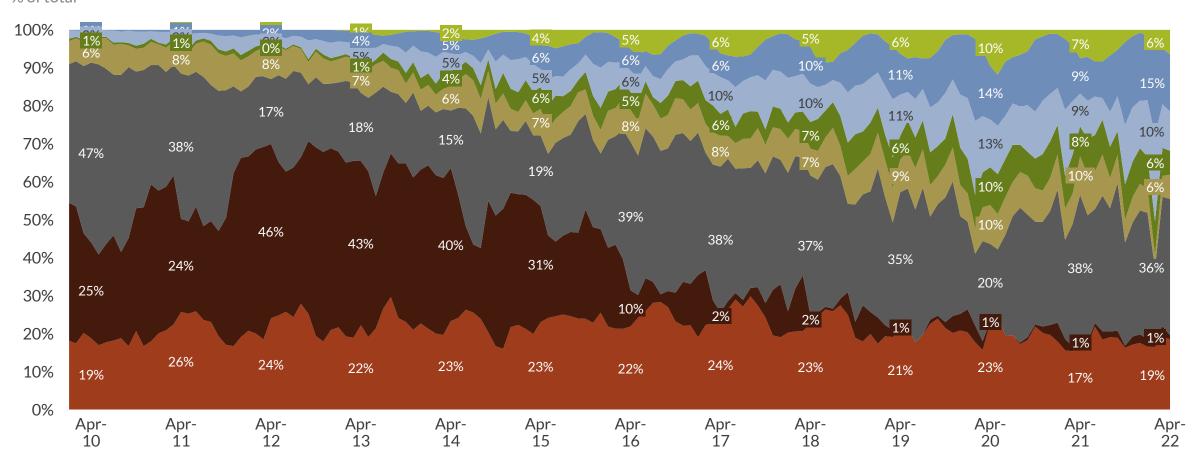

¹⁾ Includes outputs from generators registered as BM Units as well as embedded wind and solar PV assets. All numbers are rounded to 0.1 TWh which means that subtotals may not sum to total value. 2) Other fossil includes oil, CHP-CCGT and OCGT. 3) Other renewables includes biomass and hydro.

Historical fuel mix breakdown

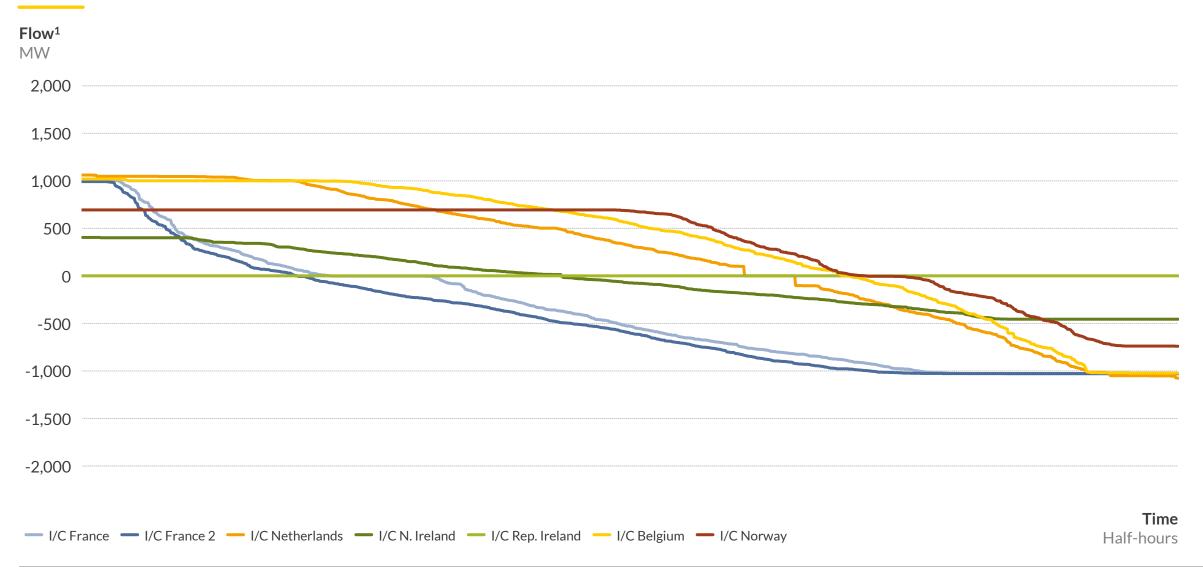

Nuclear Coal CCGT Other fossil² Other renewables³ Onshore Wind Offshore Wind Solar

¹⁾ Includes outputs from generators registered as BM Units as well as embedded wind and solar PV. 2) Other fossil includes oil, CHP-CCGT and OCGT. 3) Other renewables includes biomass and hydro.

Monthly interconnector flow duration curve Flow in each half-hour for GB interconnectors

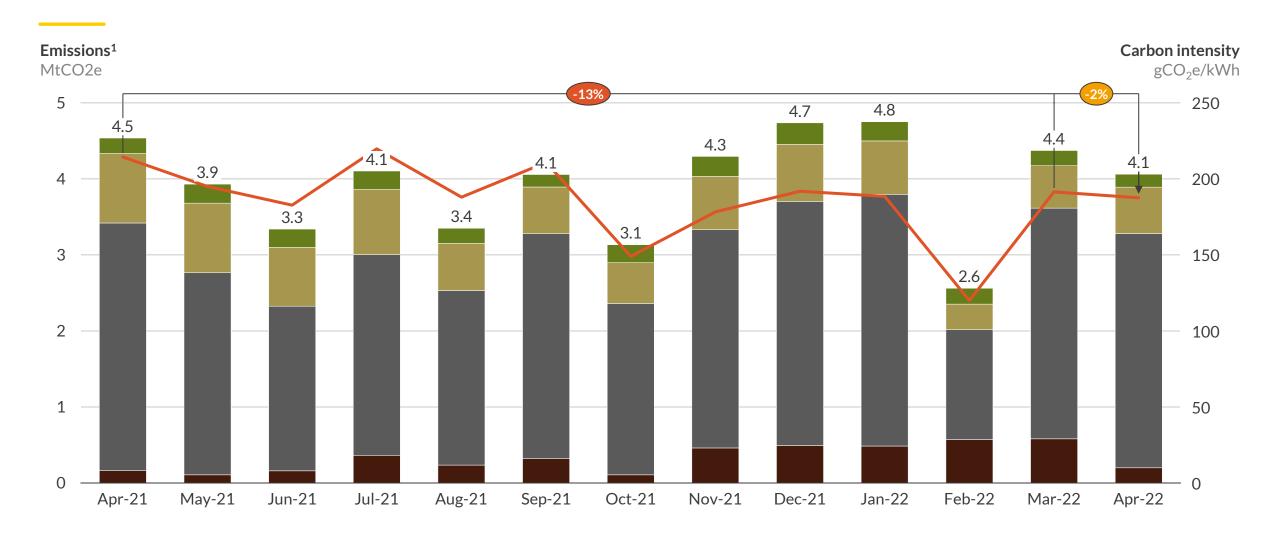

¹⁾ Positive flow is imports into GB, negative flow is exports.

Monthly emissions by technology

Biomass Other fossil² CCGT Coal — System carbon intensity

1) Please refer to Appendix for details of methodology employed to calculate emission amounts. Includes all Balancing Mechanism plants. 2) Other fossil includes oil, OCGT and gas CHP-CCGT.

Year-on-year difference

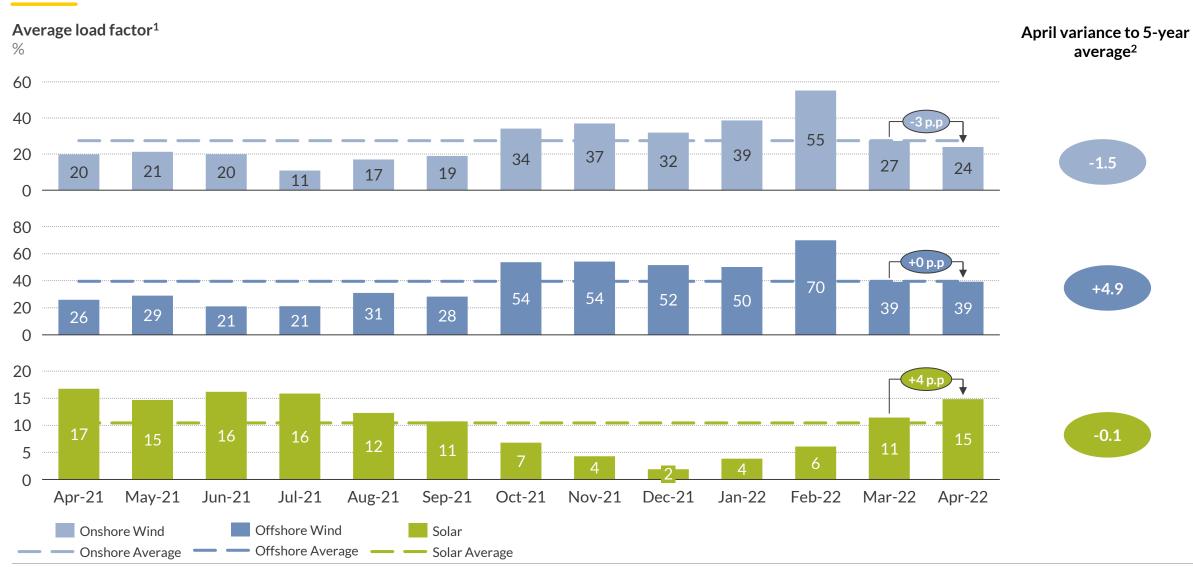

Agenda

- I. Wholesale market summary
- II. Renewable performance (redacted)
- III. Company performance (subscriber only)
- IV. Plant performance (redacted)
- V. Balancing mechanism summary

Monthly load factors by technology

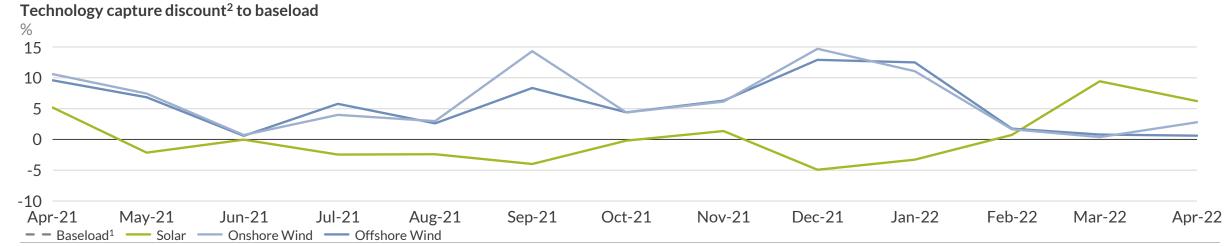

¹⁾ Includes outputs from generators registered as BM Units as well as embedded wind and solar PV; 2) Comparing to the average of same month in the previous 5 years

Sources: Aurora Energy Research, Elexon CONFIDENTIAL 17

Capture price versus baseload APX price

¹⁾ The baseload price is the average monthly APX spot price. The capture price of a technology is the load-weighted monthly average APX price across all half-hourly periods; 2) Includes generators registered as BM Units as well as embedded wind

Plant utilisation – load factors by plant for April

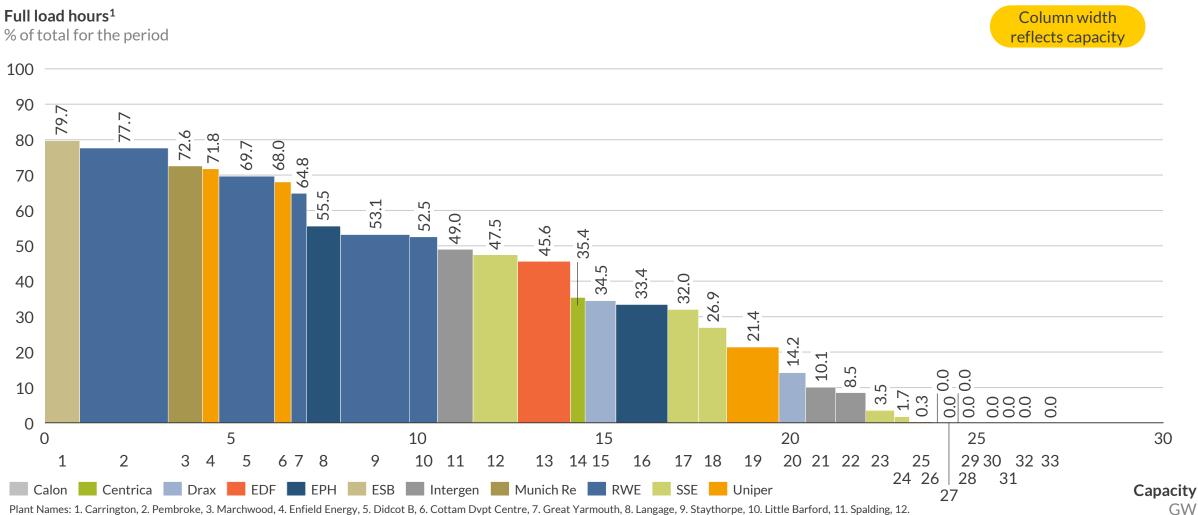

1) Represents 60 plants with highest capacity according to the Balancing Mechanism (BM) database, as well as aggregated data for wind and solar. Capacity of each plant represents the sum of capacities of all its generators that have been active at least once in the last three months. Please refer to Appendix for a detailed description of the data used and categories presented

CCGT plant utilisation - by plant for April

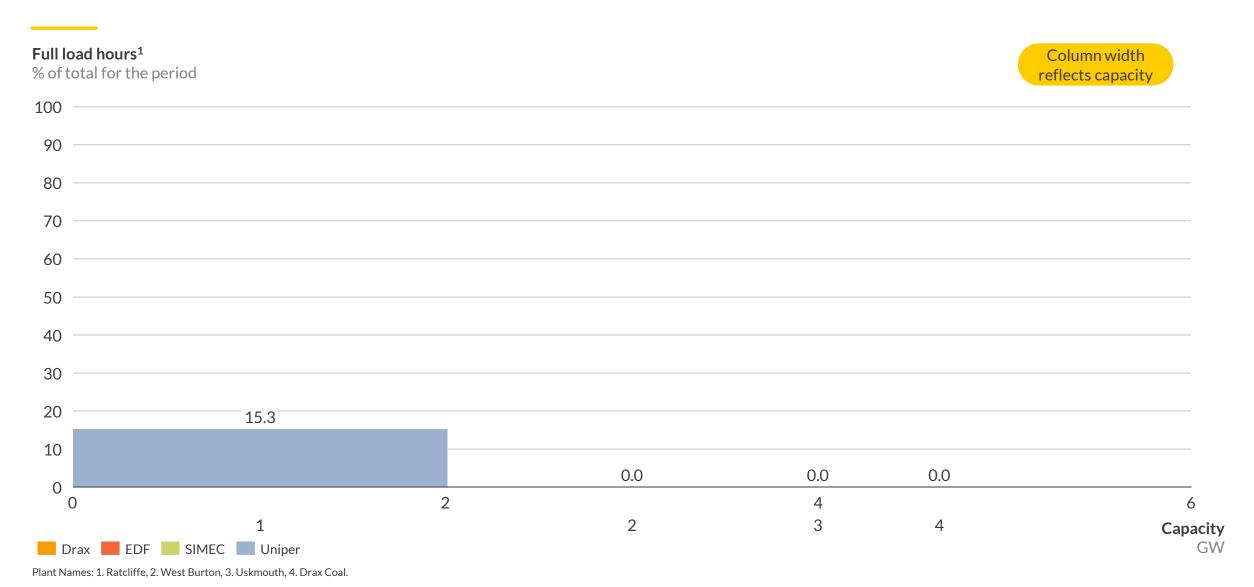

Plant Names: 1. Carrington, 2. Pembroke, 3. Marchwood, 4. Enfield Energy, 5. Didcot B, 6. Cottam Dvpt Centre, 7. Great Yarmouth, 8. Langage, 9. Staythorpe, 10. Little Barford, 11. Spalding, 12. Peterhead, 13. West Burton B, 14. Kings Lynn, 15. Damhead Creek, 16. South Humber Bank, 17. Seabank 1, 18. Medway, 19. Connahs Quay, 20. Rye House, 21. Coryton, 22. Rocksavage, 23. Keadby, 24. Seabank 2, 25. Killingholme 2, 26. Peterborough, 27. Corby, 28. Glanford Brigg, 29. Shoreham, 30. Severn, 31. Killingholme 1, 32. Sutton Bridge, 33. Baglan Bay.

MW

Bid-offer acceptance volumes breakdown by technology for the last 13 months

Accepted offer¹ volumes

Accepted bid² volumes

GWh

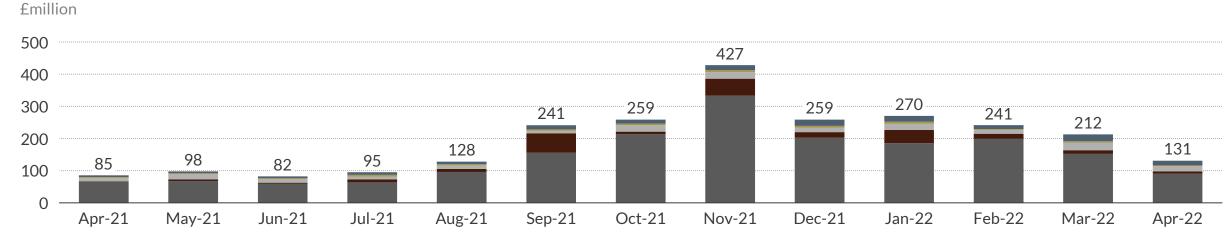

Bid-offer payments breakdown by technology for the last 13 months

1) Offers to increase generation or reduce demand; 2) Bids to reduce generation or increase demand; 3) Positive cashflow means payment to generators, negative is payment to National Grid; 4) Other includes oil, CHP-CCGT, biomass and hydro; 5) Peaking includes OCGT, reciprocating engines and DSR; 6) Storage includes batteries and pumped storage

Sources: Aurora Energy Research, Elexon

Appendix

Data used

- Output values used in this summary reflect the sum of Final Physical Notifications (FPN) submitted by all BM Units of a given plant that have been active over the last three months.
- Capacity values used in this summary reflect the sum of capacities of individual BM Units, as reported to the Balancing Mechanism, that have been active over the last three months. They reflect long-term capacities and exclude temporary fluctuations due e.g. to plant failures or scheduled maintenance.
- Prices used in this summary are the EPEX half-hourly Reference Prices for half-hourly, two-hourly and four-hourly spot products.

Categories presented

- Full-load hours represent the plants' load factors, calculated as the ratio of the output produced in a given month to the maximum possible output given the plants' capacity.
- Running hours represent the proportion of time in a given month when a plant has been active, i.e. when at least one of its BM Units produced output greater than zero.
- Capture prices (or average output-weighted prices) are calculated as an average of EPEX half-hourly prices per MWh weighted by the plants' corresponding half-hourly outputs for all periods.
- Average gross margins are calculated as a sum of the uplift and inframarginal rent. Uplift is calculated as the difference between the EPEX price and the system marginal cost (SMC). SMC is the maximum marginal cost of all the plants with at least one generator producing above 80% of its installed capacity in a given half-hour.
- Emissions are calculated as plant output divided by electrical efficiency, multiplied by theoretical carbon content of the fuel input. The carbon content of fuel inputs is sourced from BEIS's Greenhouse gas reporting Conversion factors 2016. System carbon intensity is calculated as the total emission divided by total electricity generated.
